For years we have been attempting to treat water problems at the wrong place. We should be treating them where they exist – at the well.

Treating water problems at the source is a great way to remove rotten egg smell, kill potential harmful bacteria, and eliminate staining issues. The Sentry I Dry Pellet Chlorinator works like a gum ball machine. It drops the precise amount of chlorine down your well, into the water supply, and only operates when the well pump runs. In other words, the Sentry I Dry Pellet Chlorinator is standing guard over your well 24 hours a day, 7 days a week helping keep your water safe and providing peace of mind. Sentry I Dry Pellet Chlorinators are adaptable to 120v, 240v and VFD (Variable Speed Drive) applications. Our chlorinators have been proven on stinky water, iron bacteria, and in homes that have little room for treatment.

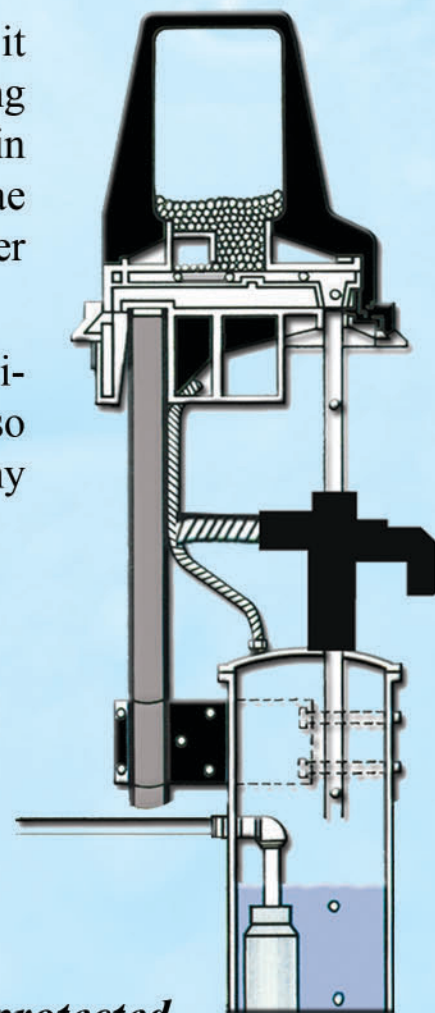

The benefits of well chlorination are substantial in that it reduces plugged pumps and water lines, along with reducing water staining in and around your home. Chlorinated water in farm applications are noticeable as well in that it reduces algae growth in watering tanks, which increases the amount of water animals consume and improves your animal's health.

As always, we recommend working with a local water conditioning professional for proper sizing and installation. We also do recommend additional filtration to remove chlorine and any remnants after the chlorination process is completed.

Use NSF

Certified Chlorine

In our evolving world the aquifers that once were protected are becoming polluted. We ask, "Is your well water safe?"
